AI VISIBILITY REPORT

Is your business invisible to AI?

RADON MITIGATION SIOUX FALLS

radonmitigationsiouxfalls.com

AUDIT DATE

August 3, 2026

BUSINESS TYPE

Radon Mitigation Contractor

LOCATION

Sioux Falls, SD

PLATFORM

Static HTML (Cloudflare)

Overall GEO Score: 42 / 100 (Poor)

Radon Mitigation Sioux Falls has a fast, well-built, server-rendered site with genuinely strong radon content – and almost none of it is reaching the AI engines. The biggest gaps are Platform Optimization (0), Brand Authority (8) and Content E-E-A-T (26): your robots.txt actively blocks ChatGPT, Claude and Gemini from reading a single page, and the business has no Google Business Profile or third-party listing anywhere for an AI to verify it exists. The good news is every gap below is fixable.

*Timeline depends on competitor behavior and how quickly the AI engines change – which is exactly why staying recommended is ongoing work, not a one-time fix.

SCORE BREAKDOWN

CATEGORY	SCORE	WEIGHT	WEIGHTED
AI Citability	71/100	25%	17.8
Brand Authority	8/100	20%	1.6
Content E-E-A-T	26/100	20%	5.2
Technical GEO	76/100	15%	11.4
Schema & Structured Data	60/100	10%	6.0
Platform Optimization	0/100	10%	0.0
Overall GEO Score	42/100		42.0

WHAT IS GEO – AND WHY IT MATTERS

Traditional SEO is about ranking in Google's blue links. **Generative Engine Optimization (GEO)** is about being the business that AI assistants — ChatGPT, Google's AI Overviews, Perplexity, and Gemini — actually name and recommend when someone asks them a question.

The shift: more and more customers now ask an AI assistant “who's the best option near me?” instead of scrolling a page of search results. The AI replies with a short list of names — usually just two or three. If your business isn't on that list, the customer never sees you at all. There's no page two to scroll to, and no ad to buy your way onto. GEO is how you get on that list.

The two disciplines reward different things. SEO rewards keywords, backlinks, and rankings. GEO rewards whether an AI can **read** your site, **understand** what you do, **trust** you as a real business, and **quote** you confidently. A site can rank perfectly well in Google and still be nearly invisible to AI — which is exactly the situation most local businesses are in right now, because their sites were built for the old rules.

This audit measures the six signals that decide whether AI recommends you: how citable your content is, how strong your brand presence is, your expertise and trust signals, your technical setup, your structured data, and your presence on the platforms AI learns from. Each is scored out of 100, and every gap comes with a specific, plain-English fix.

SEO AND GEO: SAME FOUNDATION, NEW FRONTIER

Here's the reassuring part: GEO isn't a teardown of everything you've done. It's built on the same foundation as good SEO. Many of the behind-the-scenes signals that help you rank in Google are the same signals that help an AI trust and recommend you:

- ✓ **A clean, fast, crawlable site** — both Google and AI have to be able to read it.
- ✓ **Structured data (schema)** — the labels that tell both search engines and AI what you are.
- ✓ **Authority & trust signals** — reviews, citations, and a real reputation count for both.
- ✓ **Clear, well-organized content** — helps you rank, and gives AI something solid to quote.

So if you've invested in SEO, much of that work pays forward. **But GEO is the new frontier**, and it raises the bar in ways traditional SEO never asked for: your content has to be quotable, your business has to be recognizable as an entity, and you have to show up on the platforms AI actually learns from. The businesses that win the next few years won't be the ones with the most keywords — they'll be the ones AI confidently names when a customer asks who to call.

That's the real opportunity: the rules are still being written, and being early is a genuine advantage. The first businesses to get this right become the “default answer” in their market — and once AI learns to recommend someone, that lead is hard to take back.

THE OPPORTUNITY

The shift is already here: in 2026, the share of consumers using AI tools to find local businesses jumped to **45% — up from just 6% a year earlier** (BrightLocal), with ChatGPT leading the way. And it's growing fastest in exactly the high-intent, local searches that drive radon mitigation calls — “best radon mitigation company in Sioux Falls”, “how much does radon mitigation cost in Sioux Falls”, “radon testing near me Sioux Falls SD”. Being the business an AI assistant names puts you in front of a buyer at the moment they're deciding who to call.

45%

OF CONSUMERS NOW USE AI TO FIND
LOCAL BUSINESSES — UP FROM 6% A
YEAR AGO

~\$1,800

TYPICAL RADON MITIGATION SYSTEM
VALUE (ILLUSTRATIVE)

\$43,200

VALUE OF JUST 2 EXTRA CALLS/MO
THAT CLOSE, PER YEAR

And unlike ads, an AI recommendation isn't something you rent — you earn it by being the clearest, most trustworthy answer, and it keeps paying off.

Figures above are illustrative scenarios to frame the opportunity, not guarantees. The point: even a small share of AI-driven calls is meaningful revenue for a local radon mitigation contractor — and right now that share is going to competitors who are easier for AI to recommend.

HOW YOU STACK UP

We scored three local competitors on the same GEO criteria. Two of them are already ahead — meaning when an AI assistant gets asked about roofing in the area, they're more likely to be the names it gives. This is the single clearest sign of money currently walking out the door.

BUSINESS	GEO SCORE	STANDOUT STRENGTH
Dakota Radon Mitigation	50/100	Pending benchmark
Rushmore Radon Mitigations	50/100	Pending benchmark
Radon Mitigation Sioux Falls (you)	42/100	Genuinely deep, specific radon content and a fast, fully server-rendered site
Dakota Basement Systems	50/100	Pending benchmark

Your score of 42 puts you **behind** the competitors benchmarked so far. Full competitor scoring requires individual audits – but this table shows the opportunity. The single biggest gap to close is corroboration: Dakota Radon Mitigation appears on Google, Yelp, BBB, Angi and Nextdoor with a named owner and a street address, while your business appears on none of them, so an AI asked to recommend a radon contractor in Sioux Falls has nothing to confirm you exist.

AI is already deciding who your next customers call. Right now it's pointing them at your competitors – the rest of this report is the map to change that.

ARE YOU SHOWING UP IN AI SEARCH?

This is the heart of a GEO audit. We asked the major AI assistants the real questions your customers ask before hiring a local business and recorded who they recommend. (Results are a representative snapshot — AI answers vary by user and shift over time.)

THE QUESTIONS YOUR CUSTOMERS ASK AI

BUYER QUESTION	DO YOU APPEAR?
"Best radon mitigation company in Sioux Falls, SD"	NOT MENTIONED
"Who should I call for radon mitigation in Sioux Falls?"	MENTIONED ONCE
"How much does radon mitigation cost in Sioux Falls, SD?"	NOT MENTIONED
"Radon testing near me in Sioux Falls, South Dakota"	NOT MENTIONED

WHAT CHATGPT SAYS RIGHT NOW

CHATGPT — "BEST RADON MITIGATION COMPANY IN SIOUX FALLS, SD"

"While I can't provide real-time recommendations or reviews, I can suggest a few steps to help you find the best radon mitigation company in Sioux Falls, SD: 1. **Online Reviews:** Check platforms like Google, Yelp, or Angie's List for customer reviews and ratings of radon mitigation companies in the area. 2. **Certifications:** Look for companies that are certified by the National Radon Proficiency Program (NRPP) or the National Radon Safety Board (NRSB). These certifications indicate that the"

Your business isn't in the answer. Your competitors are. That's the gap this report closes.

VISIBILITY ACROSS THE AI ENGINES

AI ENGINE	APPEARS IN THE ANSWER?
ChatGPT	SOMETIMES
Google AI Overviews	NO
Gemini	NO

SHARE OF VOICE VS COMPETITORS

Across the 4 buyer questions we tested on 3 AI engines, here's how often each business appeared in the answer:

WHERE AI GETS ITS ANSWERS

When AI recommends a business, it pulls from these sources. Here's where you show up — and where you're missing:

- ✗ Google Business Profile — No knowledge panel found for 'Radon Mitigation Sioux Falls', and the business is not in the local pack for 'radon mitigation Sioux Falls SD' – Dakota Radon Mitigation, Rushmore Radon Mitigations and Radon Crew hold those slots. No street address is published anywhere, which is what currently blocks GBP verification.
- ✗ Bing Places — Not listed. No Bing Places card or bing.com/maps entry. This one matters disproportionately: ChatGPT's web search layer is Bing-backed, so a missing Bing listing suppresses ChatGPT visibility directly.
- ✗ AARST / NRPP certified radon professional directory — Not found in nrpp.info/pro-search for South Dakota or on certifiedradonpros.org. The site claims 'NRPP-Certified' in six places, but South Dakota has no state radon licensing, so this directory is the de facto trust source – and the claim is currently unverifiable from it.
- ✗ Yelp — Absent from the Sioux Falls radon mitigation results. Dakota Radon Mitigation and Rushmore Radon Mitigations both hold Yelp pages with photos and reviews.
- ✗ Better Business Bureau — No BBB profile. Dakota Radon Mitigation LLC, Radon Crew LLC and Radon Mitigation Systems LLC all have Sioux Falls BBB profiles, several rated A+.
- ✗ Angi / HomeAdvisor — Not on the Angi Sioux Falls radon testing company list or the HomeAdvisor equivalent. Dakota Radon Mitigation carries an Angi 5.0 reviews page.
- ✗ Industry lead directories (National Radon Defense, RadonResources, RadonAway locator) — Absent from all three. These pages rank on page one for 'radon mitigation Sioux Falls' and are routinely scraped by AI engines to assemble a contractor shortlist for exactly this query.
- ✗ Nextdoor, Facebook & Reddit — No footprint on any of them. Competitor names surface in r/SiouxFalls radon threads and on Nextdoor neighbor recommendations, which AI engines weight heavily for 'who do people recommend' phrasings.

CRITICAL & HIGH PRIORITY ISSUES

CRITICAL ROBOTS.TXT BLOCKS GPTBOT AND CLAUDEBOT OUTRIGHT

The Cloudflare Managed Content block in your robots.txt issues **Disallow: /** to GPTBot (OpenAI) and ClaudeBot (Anthropic). ChatGPT and Claude are being told, in writing, that they may not fetch a single page on radonmitigationsiouxfalls.com. Everything good on this site – the sub-slab depressurization explanation, the 4.0 pCi/L action level, the FAQ schema, the \$800 to \$2,500 price table – is invisible to the two largest AI assistants no matter how well it is written. This is the single largest constraint on the entire audit. **Fix:** in the Cloudflare dashboard under Security > Bots > AI Crawl Control, disable the managed AI-crawler block (or remove the GPTBot and ClaudeBot Disallow groups from the robots.txt override) so both crawlers get Allow: /.

CRITICAL GOOGLE-EXTENDED IS BLOCKED, CUTTING OFF GEMINI AND GOOGLE AI ANSWERS

robots.txt also contains **User-agent: Google-Extended / Disallow: /**. Google-Extended is the specific control governing whether your content may be used to ground Gemini and Google's AI-generated answers. Blocking it means you can still rank in the classic blue links while being formally excluded from AI Overviews and Gemini responses for queries like 'radon mitigation Sioux Falls cost'. The same block also disallows CCBot, Amazonbot, Applebot-Extended,

Bytespider and meta-externalagent. **Fix:** remove the Google-Extended Disallow group so Google can use the pages for AI grounding, which leaves normal Googlebot indexing completely intact.

CRITICAL ZERO THIRD-PARTY CORROBORATION – THE BUSINESS IS UNVERIFIABLE TO AN AI ENGINE

Searches for the business name, the domain, and the phone number (605) 525-8529 returned no result on Google, Bing, Apple Maps, Yelp, BBB, Angi, Nextdoor, Facebook, the AARST/NRPP directory, National Radon Defense, RadonResources, YellowPages, Reddit or YouTube. An AI building an answer to ‘who does radon mitigation in Sioux Falls’ has exactly one source available – your own website – and no independent confirmation that the company operates, is certified, or has customers. Single-source entities get dropped from generated shortlists in favor of entities with three or more corroborating sources, which is precisely why Dakota Radon Mitigation, Rushmore Radon Mitigations and Dakota Basement Systems keep appearing instead. The structural blocker is that no street address is published anywhere, so there is nothing to verify a Google Business Profile against. **Fix:** register at a real physical address (a home office is fine), claim the Google Business Profile as a service-area business with the address hidden, complete verification, then add Bing Places, Apple Business Connect, Yelp, BBB and Angi within the same 30 days using one identical name, phone and service-area definition.

CRITICAL NO NAMED HUMAN ANYWHERE ON A YMYL HEALTH-AND-SAFETY SITE

Radon mitigation is cancer prevention – your own homepage states radon causes about 21,000 lung-cancer deaths a year – which puts this content squarely in YMYL (Your Money or Your Life) territory. Yet across the homepage, /about, the service pages, /reviews, /contact and all seven education pages, not one person is named. /about opens with ‘We’re a locally owned and operated radon company’ and never introduces an owner, founder or technician. There is no bio, no headshot, no team section, and no author byline on /radon-and-your-health or /radon-levels-south-dakota, the two pages making direct health claims. AI answer engines weight named, attributable expertise heavily when deciding whose health claims to repeat, and an entirely anonymous operator is close to uncitable. **Fix:** add a named owner or lead technician to /about with a real photo, a short career bio and years in radon work, then repeat that byline as the author on every education page.

CRITICAL ‘NRPP-CERTIFIED’ AND ‘LICENSED’ ARE CLAIMED WITH NO VERIFIABLE NUMBER

The NRPP certification claim appears in the hero trustline, the ‘Why Sioux Falls Trusts Us’ block, the /about bullet list, the /about FAQ answer, the service-page body copy and two meta descriptions – six or more assertions, and not one carries a certification ID, a certificant name, or a link to the NRPP lookup directory. ‘Licensed & Insured’ runs in the topbar and footer of every page with no license number and no carrier. NRPP credentials are issued to named individuals and are publicly searchable, and the business does not currently appear in that directory for South Dakota. An unverifiable credential claim is worse than no claim, because it can be actively contradicted. **Fix:** display the NRPP certificant name and measurement/mitigation ID numbers in the footer, link each to its public verification page, and get the company listed in the NRPP directory.

CRITICAL AGGREGATERATING 5.0 ASSERTED IN SCHEMA WITH NO REVIEW OBJECTS AND NO EXTERNAL SOURCE

The homepage LocalBusiness block declares "aggregateRating": {"ratingValue": "5.0", "reviewCount": "4"} with zero Review objects, no author or datePublished data, and no reference to any third-party review platform. Google's review snippet guidelines explicitly disallow self-serving reviews about a business hosted by that business, and unsupported aggregate ratings can trigger a structured-data manual action rather than simply being ignored. The claim is also internally inconsistent: the visible homepage reviews section shows three testimonials (Megan R., Dave K., Sarah L.) against a reviewCount of 4. AI engines that cross-check schema against page content will discount the entire node. **Fix:** remove the aggregateRating until a real Google Business Profile review corpus exists, then restore it so the rating and count exactly match the live public profile, linked via sameAs.

HIGH CONTENT-SIGNAL TELLS COMPLIANT AI SYSTEMS AI-TRAIN=NO, USE=REFERENCE

The wildcard group in robots.txt carries Content-Signal: search=yes, ai-train=no, use=reference. Search indexing is permitted, but AI training is refused and AI use is restricted to reference only. Layered on top of the outright Disallow lines, this is a second signal telling compliant AI systems to keep the site at arm's length. For a lead-generation service business whose whole goal is to be named in AI answers, this works directly against the objective. **Fix:** change the signal to search=yes, ai-input=yes, use=full, or drop the Content-Signal line entirely, so AI assistants are cleared to quote and cite the pages.

HIGH NO BING PLACES LISTING, WHICH SUPPRESSES CHATGPT SPECIFICALLY

ChatGPT's web search layer is Bing-backed, so a business with no Bing Places entry and no Bing-indexed third-party profiles is effectively invisible to the largest consumer AI assistant even before the GPTBot block is considered. No Bing Places card, bing.com/maps entry, or Bing-indexed directory profile exists for this business. **Fix:** claim the free Bing Places for Business listing – it can be bulk-imported from Google Business Profile once that exists – and confirm it actually appears on bing.com/maps before treating this as done.

HIGH NO SAMEAS LINKS OR SOCIAL PROFILES, SO THERE IS NO ENTITY GRAPH TO ATTACH TO

Not one of the four pages audited contains a sameAs property, and the site has no Facebook, Instagram, LinkedIn, Google Business Profile or directory link in the header, footer or anywhere else. sameAs is the primary mechanism by which a website tells search engines and LLMs 'this site and that profile are the same company'. Without it, the schema is a set of self-assertions with nothing to reconcile against, and the site is an orphan node that cannot inherit trust from any rating or review count anywhere. **Fix:** once the GBP, Bing, Yelp, BBB and Facebook listings exist, add every profile URL to a sameAs array on the LocalBusiness schema, and link the same profiles from the footer.

HIGH LOCALBUSINESS SCHEMA HAS NO @ID, SO FOUR PAGES DECLARE FOUR DISCONNECTED BUSINESSES

The LocalBusiness JSON-LD is duplicated verbatim on the homepage, /about, /radon-mitigation-sioux-falls and /radon-mitigation-cost-sioux-falls with no @id property on any copy, and the Service blocks nest a stripped-down inline provider (name and telephone only) rather than referencing the business node. A parser building a knowledge graph sees five or

more separate unlinked entities instead of one company with pages and services attached, so nothing accumulates. The copies also disagree: the homepage lists 8 areaServed cities while the other three list 10, adding Hartford and Crooks. **Fix:** give the LocalBusiness a canonical @id such as <https://radonmitigationsiouxfalls.com/#business>, reference it from every page and from each Service block via "provider": {"@id": "..."}, and make the areaServed list identical everywhere.

HIGH NO STREET ADDRESS ON ANY PAGE, AND POSTALADDRESS SCHEMA OMITTS STREETADDRESS

The footer contact column lists only 'Sioux Falls, SD', /contact gives a phone number and email but no physical location, and every LocalBusiness JSON-LD block provides addressLocality, addressRegion and addressCountry with no streetAddress, no postalCode and no geo coordinates. A contractor performing in-home work on a health hazard, with no verifiable place of business, fails the most basic trust check for human buyers and for the entity-resolution step AI engines run before citing a local business. It is also what blocks Google Business Profile verification, which makes this the load-bearing fix behind several other findings. **Fix:** publish the full street address in the footer (or a stated service-area business address consistent with the GBP) and add streetAddress, postalCode and geo coordinates to every LocalBusiness block.

HIGH EVERY HEALTH AND TECHNICAL STATISTIC IS UNCITED - ZERO OUTBOUND LINKS SITEWIDE

The site makes repeated, specific, authority-derived claims: '21,000 lung-cancer deaths a year', 'the EPA and Surgeon General estimate', '1 in 15 U.S. homes', '4.0 pCi/L', '~99% reduction', '#2' for South Dakota's radon ranking, and 'much of eastern South Dakota is classified EPA Zone 1'. A scan of every page fetched found **zero** href values pointing to any external domain – no epa.gov, no Surgeon General, no WHO, no AARST, no South Dakota DANR. The authorities are named in prose but never linked, so the numbers are effectively unsourced assertions. AI engines preferentially cite pages that themselves cite primary sources, which makes this the cheapest E-E-A-T gain available here. **Fix:** add inline outbound links to the EPA Citizen's Guide to Radon, the Surgeon General's radon health advisory, the EPA Map of Radon Zones and the AARST standards next to each corresponding statistic.

HIGH THE HOMEPAGE FAQ REFUSES TO NAME A PRICE, UNDERCUTTING THE ONE PAGE THAT DOES

/radon-mitigation-cost-sioux-falls is the strongest page on the site: it states \$800 to \$2,500 in prose, adds a four-row price table, quantifies a second system at roughly \$500 to \$900, and carries those figures into FAQPage schema. But the homepage FAQ and its FAQPage JSON-LD answer the identical question 'How much does radon mitigation cost in Sioux Falls?' with 'Most residential radon mitigation systems fall in a typical range depending on your home's size, foundation, and layout' – no number at all – and the main service page repeats the same evasive answer. The homepage is the most-crawled and most-linked URL on the domain, so the version most likely to be ingested is the one containing no extractable figure. Two conflicting structured answers to one question also reduces confidence in whichever one gets retrieved. **Fix:** propagate the concrete \$800 to \$2,500 figures into the homepage and service-page FAQ text and both FAQPage schema blocks so all three agree.

HIGH**MISSING FROM THE INDUSTRY LEAD DIRECTORIES THAT ALREADY RANK FOR THE TARGET QUERY**

National Radon Defense's Sioux Falls contractor page, the RadonResources Sioux Falls directory and the RadonAway South Dakota contractor locator all rank on page one for 'radon mitigation Sioux Falls', and they are the pages AI engines scrape when assembling a contractor shortlist for this exact query type. This business appears on none of them; competitors appear on several. **Fix:** apply for inclusion in the National Radon Defense contractor network and the RadonAway contractor locator, and submit the business to the RadonResources Sioux Falls directory.

MEDIUM & LOW PRIORITY ISSUES**MEDIUM****TWO CONFLICTING 'USER-AGENT: *' GROUPS IN ROBOTS.TXT**

robots.txt declares User-agent: * twice: once inside the Cloudflare Managed Content block (with Allow: / and the Content-Signal) and again at the bottom with a bare Disallow: . Two separate records for the same user-agent token is ambiguous under RFC 9309 – crawlers may merge them, and stricter parsers may honour only the first group and ignore the second along with the Sitemap line beneath it. The Sitemap directive is global so it should still be read, but this is unnecessary risk on a file that is already causing problems. **Fix:** consolidate into a single User-agent: * group with Allow: /, and move the Sitemap declaration to its own line at the top of the file.

MEDIUM**LLMS.TXT EXISTS BUT OMITTS THE AUTHORITY AND PRICING CONTENT AI SYSTEMS MOST NEED**

llms.txt returns HTTP 200 and is correctly formatted with a title, a one-line summary, phone, service area and six service links – which already puts the site ahead of most competitors. It stops there. There are no entries for /about, /radon-mitigation-cost-sioux-falls (the strongest citable page on the site), /radon-faq, /reviews or any of the education and city pages, and no one-line description of what each linked page contains, which is the part an AI agent actually uses to decide what to fetch. sitemap.xml lists 31 URLs while llms.txt surfaces 6. **Fix:** expand llms.txt to cover all 31 URLs grouped by section (Services, Service Areas, Resources) each with a one-sentence description, add an About section stating credentials, a Pricing line quoting the \$800 to \$2,500 range, and an FAQ section carrying the homepage question-and-answer pairs.

MEDIUM**SERVICE SCHEMA IS PRESENT BUT SKELETAL, WITH NO OFFER DESPITE PUBLISHED PRICING**

Both service pages carry a Service block, but each has only serviceType, a one-line description, a stub provider and a single-city areaServed. There is no name, no url, no offers/Offer with a priceSpecification, and no hasOfferCatalog on the business node tying the six services in llms.txt into one catalog. This matters most on the cost page, where the visible page and the FAQ schema both state a concrete \$800 to \$2,500 range that is nowhere expressed as structured pricing – exactly the fact an AI engine would quote if it could parse it. **Fix:** expand each Service with name and url, add an offers/Offer carrying a PriceSpecification (minPrice 800, maxPrice 2500, priceCurrency USD) on the cost page, and add hasOfferCatalog to the LocalBusiness node covering all six services.

MEDIUM NO ORGANIZATION, WEBSITE OR BREADCRUMBLIST SCHEMA ANYWHERE

Three site-wide schema types that should be global are entirely absent: Organization (the corporate entity, logo, contactPoint and founding details), WebSite (url, name, publisher and potentialAction/SearchAction) and BreadcrumbList. There is no breadcrumb markup of any kind and no visible breadcrumb navigation, so neither Google nor an AI crawler can infer the hierarchy from /radon-mitigation-cost-sioux-falls back up to the service and home tiers. The generic @type: LocalBusiness is also a missed opportunity when schema.org offers HomeAndConstructionBusiness. **Fix:** add a site-wide Organization node with logo and contactPoint, a WebSite node linked to it via publisher, a BreadcrumbList on every non-home page, and change the business @type to ["LocalBusiness", "HomeAndConstructionBusiness"].

MEDIUM TESTIMONIALS ARE FIRST-NAME-ONLY AND ARE BEING USED TO BACK A SCHEMA RATING

All four reviews (Megan R. of Sioux Falls, Dave K. of Brandon, Sarah L. of Harrisburg, Jason M. of Tea) appear on the homepage and /reviews with no date, no photo, no platform attribution and no link to a Google, Facebook or BBB profile where they could be checked. There are also no project details in any of them – no radon readings before and after, no home type, no neighborhood. AI systems treat unverifiable on-site testimonials as promotional content and will not repeat them as evidence of quality. **Fix:** collect reviews on a live Google Business Profile, then cite them on /reviews with a visible link to the source profile and Review schema carrying author, datePublished and the platform URL.

MEDIUM NO DATES, FRESHNESS SIGNALS OR CONTENT-PROVENANCE MARKUP ON ANY PAGE

Not one page carries a published or updated date, and a search for datePublished, dateModified or author across all pages returned zero matches – the JSON-LD is limited to LocalBusiness, Service, AboutPage and FAQPage with no Article or WebPage provenance. The only temporal signal on the entire site is the '© 2026' footer line and a '(2026 Guide)' string in the cost page title tag that never appears in the visible H1 or body. For health guidance and for a cost guide, recency is a direct citability factor: an engine choosing between two radon cost pages will prefer the one that timestamps its figures. **Fix:** add a visible 'Last updated' line to the cost page and all seven education pages, and emit Article or WebPage JSON-LD carrying datePublished, dateModified and a named author.

MEDIUM NO YEARS IN BUSINESS, CUSTOMER COUNT, AWARDS OR PRESS MENTIONS

Authoritativeness signals are entirely absent: no founding year or 'serving Sioux Falls since 20XX', no count of homes mitigated, no BBB rating or accreditation, no AARST/NRPP member badge, no chamber of commerce or SD Realtors affiliation, no award and no media mention on any page. The strongest claims available are the qualitative 'Local & Family-Run' trustbar item and 'we live and work here'. Competitors supply exactly the numeric facts an AI extracts when comparing contractors – Dakota Radon Mitigation publishes 'since 2005' and '3,000+ homes'. **Fix:** state the founding year and the number of systems installed to date on /about and in the footer, and add any BBB, AARST or local association memberships with links to their public listings.

MEDIUM**NO NEXTDOOR, FACEBOOK OR REDDIT FOOTPRINT IN A MARKET WHERE WORD OF MOUTH IS THE QUERY**

Sioux Falls radon recommendations circulate on Nextdoor, in local Facebook groups and on r/SiouxFalls, and competitor names surface there attached to specific praise. These community sources are weighted heavily by AI engines answering 'who do people recommend' phrasings, and this business has zero footprint across all of them. Related: there is no review corpus on any platform, so even if the business were named in an AI answer, there would be no rating or review count for the engine to quote alongside it. **Fix:** create a Nextdoor business page and a Facebook business page, then after GBP verification run a review request to every past customer with a direct review link, targeting 20 or more Google reviews in the first 90 days.

LOW**MOBILE LARGEST CONTENTFUL PAINT IS CONSISTENTLY 2X TO 3X OVER TARGET**

Desktop performance is excellent and stable at 96. Mobile is the weak spot and it is genuinely unstable: across three repeat PageSpeed runs the mobile score ranged from 64 to 80 and largest contentful paint ranged from 5.3 to 8.8 seconds, every one of them well over the 2.5s threshold. Cumulative layout shift is excellent throughout (0 to 0.016), so this is purely a load-speed problem, not a stability one. Lighthouse reports the LCP resource is not discoverable in the initial document and carries no fetchpriority hint. The header logo is also a 369 KB PNG served at 458x603 but displayed at 84x116, roughly 402 KB of wasted image bytes, which is the most likely cause of the swing. **Fix:** add `<link rel="preload" as="image" fetchpriority="high" href="/assets/hero-1280.webp">` to the head, convert the logo to a properly sized WebP, and add explicit width and height attributes to both logo images.

LOW**REAL TECHNICAL DEPTH IS PRESENT BUT NEVER ATTACHED TO DEMONSTRATED EXPERIENCE**

The content genuinely knows the trade: sub-slab depressurization, sump-pit and drain-tile tie-ins, crawl-space membrane depressurization, foundation sealing, manometers, multiple suction points, pipe-routing cost drivers, glacial uranium-bearing soils, EPA Zone 1, and the Minnehaha and Lincoln county radon belt. What is missing is first-hand proof: no before-and-after pCi/L readings from actual Sioux Falls installs, no photo gallery of completed systems, no case study of a difficult crawl-space or two-foundation home, and no seasonal observation tied to the site's own claim that peak testing season here is January. That is the difference between researched content and experienced content in the first E of E-E-A-T. **Fix:** add three to five short project write-ups with real before and after radon readings, home type, neighborhood, and photos of the installed system.

LOW**SERVER-SIDE RENDERING AND HEAD-LEVEL SCHEMA ARE A GENUINE STRENGTH WORTH PROTECTING**

Verified positive: the homepage is plain static HTML with no React, Next or hydration bundle. All body copy, the four service cards, the process steps, the ten-city service-area list, the reviews and the FAQ entries are in the raw response, so any crawler that is allowed in gets the full content on first fetch with zero JS execution. All JSON-LD sits in the static head ahead of the GTM snippet and none of it is injected by JavaScript. Content parity between the FAQPage schema and the visible text checks out on all four pages audited. **Fix:** keep the static build and avoid moving content behind client-side rendering – the CloudflareBrowserRenderingCrawler Disallow means JS-dependent content would be doubly unreachable.

CATEGORY DEEP DIVES

AI CITABILITY

71/100

This measures how easily AI systems can lift and quote your content. It is the strongest category in this audit. Every page carries a real FAQ block with FAQPage schema, and the cost guide leads with a direct, extractable answer (\$800 to \$2,500) plus a four-row pricing table an AI can lift verbatim. Hard numbers run throughout – 4.0 pCi/L EPA action level, ~99% reduction, 21,000 annual lung-cancer deaths, 1 in 15 homes – and the callout boxes act as self-contained fact blocks. The weakness is hedging in the wrong place: the homepage and service-page FAQs answer the single most-asked question about price with a non-answer, even though your own cost page has the real figure. Most H2s are also topic labels (“What affects the cost”) rather than the questions customers actually type.

BEFORE — HARD TO QUOTE

“Most residential radon mitigation systems fall in a typical range depending on your home’s size, foundation, and layout.”

AFTER — AI-FRIENDLY

“Radon mitigation in Sioux Falls costs \$800 to \$2,500. A single-foundation home with a straightforward pipe route runs \$800 to \$1,300; a basement plus crawl space runs \$1,600 to \$2,500.”

Fix: replace the hedged price answer in the homepage and service-page FAQs (and their FAQPage schema) with the same concrete \$800 to \$2,500 range and per-scenario figures already published on your cost page, and rewrite topic-label H2s as the questions buyers actually ask

BRAND AUTHORITY

8/100

Searches for the brand name, the domain and the phone number (605) 525-8529 returned zero third-party results: no Google Business Profile, no Yelp listing, no BBB profile, no Angi or Nextdoor page, no press coverage, no forum mentions. Every Sioux Falls radon result belongs to a competitor with a real off-site footprint – Dakota Radon Mitigation (Yelp, BBB A+ with a named owner and street address, Angi 5.0, Nextdoor, 3,000+ homes since 2005), Rushmore Radon Mitigations (Yelp with 16 photos), Radon Mitigation Systems LLC (BBB A+). On-site the business is effectively anonymous: no owner or technician named, no NRPP certification number, no street address, no social profiles and no sameAs links in any schema block, so an AI has nothing to corroborate the brand against.

Fix: create and verify a Google Business Profile with a real street address, hours, service list and photos, then build matching listings on Bing Places, Yelp, BBB, Angi and Nextdoor with identical NAP, and link them all from the footer and a sameAs array in the LocalBusiness schema

CONTENT E-E-A-T

26/100

For a YMYL health topic – the site itself states radon causes roughly 21,000 lung-cancer deaths a year – this site carries almost no verifiable E-E-A-T. Across the homepage, /about, the service and cost pages, /reviews, /contact and the education pages there is not one named owner, technician, author byline, bio, photo of a real person, years-in-business figure, license number, NRPP certification ID, street address, award or press mention. Expertise is asserted only as unverifiable labels, and every statistic used is presented with zero outbound citations – a scan of all eight pages returned exactly zero external links, to EPA,

the Surgeon General, WHO, AARST or anyone else. What the site does well is technical depth and a genuinely specific cost page, plus HTTPS, a prominent phone number and linked privacy and terms pages. But depth without attribution reads to an AI model as unsourced marketing copy.

Fix: publish a real named human on the site – owner or lead technician with photo, bio, stated years in the trade, and the actual NRPP certification number – then add outbound citations to EPA, the Surgeon General and AARST beside every statistic, and a visible ‘Last updated’ date on each education page

TECHNICAL GEO

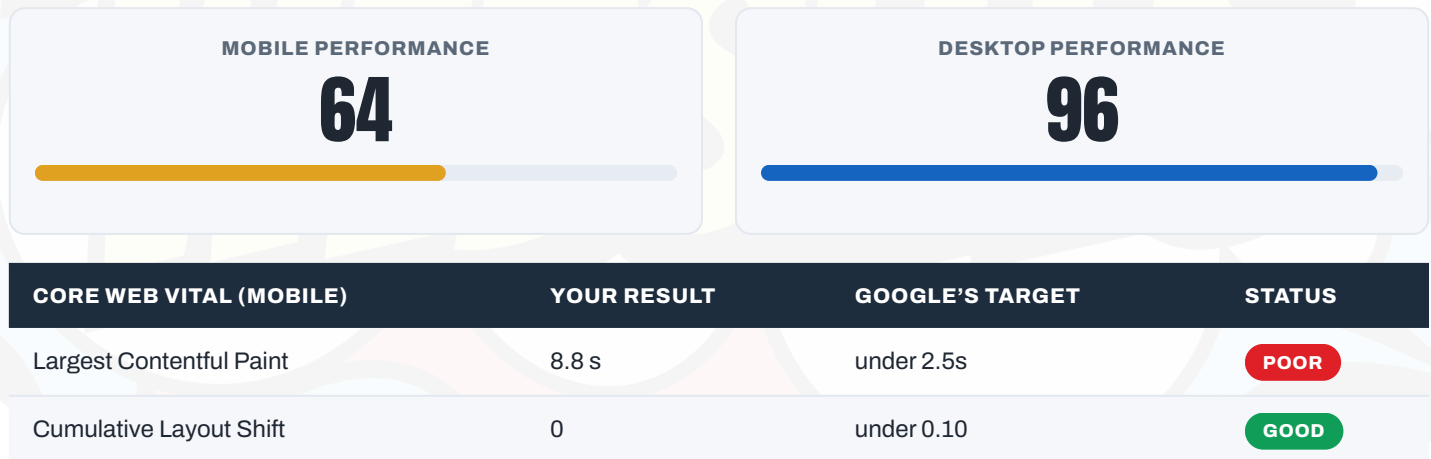

76/100

The engineering here is good and the problem is a setting, not a build. The site is fully server-rendered static HTML – every headline, service description, FAQ answer, review and service-area list is present in the raw source with no JS framework required – it ships LocalBusiness and FAQPage JSON-LD, and desktop PageSpeed is an excellent 96 with near-zero layout shift. sitemap.xml is valid and lists all 31 pages. The one serious weakness is robots.txt: a Cloudflare Managed Content block hard-blocks GPTBot, ClaudeBot, Google-Extended, CCBot, Amazonbot, Applebot-Extended, Bytespider, meta-externalagent and CloudflareBrowserRenderingCrawler with Disallow: /, and adds Content-Signal: ai-train=no, use=reference. llms.txt exists but is thin, and mobile largest contentful paint runs 5 to 9 seconds against a 2.5s target.

Fix: turn off the Cloudflare AI-crawler block for GPTBot, ClaudeBot and Google-Extended in Security > Bots > AI Crawl Control so ChatGPT, Claude and Gemini can actually read the pages, then expand llms.txt into a full content map and preload the hero image to pull mobile LCP under 2.5s

PAGE SPEED & CORE WEB VITALS

AI crawlers have to load a page to read it — slow pages get crawled less thoroughly, and a sluggish site loses the visitor even when AI does send one. Here’s where things stand, measured with Google PageSpeed Insights:

Mobile is where most local searches happen — and it’s where speed issues hurt both AI visibility and the customers who do click through.

SCHEMA & STRUCTURED DATA

60/100

Every page carries server-rendered JSON-LD: a LocalBusiness block plus a page-appropriate FAQPage on all four pages audited, a Service block on both the main service page and the cost page, and an AboutPage stub on /about. The foundation is real, but the entity is thin and unverifiable. There is no @id on any node, so the four LocalBusiness copies read as four unlinked

entities to a parser; no sameAs to a Google Business Profile or any social or directory profile; no streetAddress, postalCode, geo coordinates or openingHoursSpecification; and no Organization, WebSite, BreadcrumbList, hasOfferCatalog or Person markup anywhere. The homepage AggregateRating (5.0 across 4 reviews) is unsupported: no Review objects, no external review source, and only three visible testimonials against a claimed count of four.

Fix: rebuild the LocalBusiness as a single @id-anchored node referenced from every page, add sameAs links to the Google Business Profile and every directory listing, fill in streetAddress, postalCode, geo and openingHoursSpecification, and either remove the unsupported aggregateRating or replace it with individual Review objects that mirror a verifiable source

PLATFORM OPTIMIZATION

0/100

Radon Mitigation Sioux Falls has no confirmed presence on a single third-party platform that AI engines cite for local contractor queries. Searches for the business name, the domain and the phone number returned zero results across Google, Bing, Apple Maps, Yelp, Angi, BBB, Nextdoor, Facebook, YouTube, Reddit, the AARST/NRPP certified professional directory, National Radon Defense, RadonResources, YellowPages and the local Chamber and Home Builders Association listings. Every named competitor is present on several of those platforms with ratings and review counts attached, which is exactly the corroborating data ChatGPT, Perplexity and Google AI Overviews pull from when building a recommendation list. The load-bearing blocker is the missing street address, which is what prevents Google Business Profile verification in the first place.

Fix: claim and verify a Google Business Profile, Bing Places and Apple Business Connect listing with a consistent NAP, then add Yelp, BBB, Angi and an AARST/NRPP directory listing so at least four independent sources confirm the business exists

QUICK WINS (THIS WEEK)

1. Turn off the Cloudflare AI-crawler block so GPTBot, ClaudeBot and Google-Extended can read the site – this is a dashboard toggle and it unblocks everything else in this report
2. Claim and verify a Google Business Profile at a real street address, then mirror it to Bing Places (Bing is what powers ChatGPT's web search)
3. Put a named owner or lead technician on /about with a photo, a bio, years in the trade, and the actual NRPP certification number linked to its public verification page
4. Copy the concrete \$800 to \$2,500 pricing from your cost page into the homepage and service-page FAQ answers and their FAQPage schema, replacing the 'typical range' non-answer
5. Remove the unsupported aggregateRating from the LocalBusiness schema until real Google reviews exist, and add the street address to every PostalAddress block

PHASE 1: FOUNDATION (FIRST 30-60 DAYS)

Phase 1 takes Radon Mitigation Sioux Falls from a site AI engines are not allowed to read, and a business they cannot verify exists, to a credible, recommendable local authority. The first month follows the cadence below.

WEEK 1 – OPEN THE DOORS TO AI

- Disable the Cloudflare AI-crawler block for GPTBot, ClaudeBot and Google-Extended, and clear the ai-train=no Content-Signal

- Consolidate the duplicate 'User-agent: *' groups in robots.txt and move the Sitemap line to the top
- Register a physical address and start Google Business Profile verification

WEEK 2 - MAKE CONTENT QUOTABLE

- Replace the hedged price answers on the homepage and service page with the real \$800 to \$2,500 figures, in the copy and the FAQPage schema
- Add outbound citations to EPA, the Surgeon General and AARST beside every statistic
- Expand llms.txt from 6 links to the full 31-URL content map with per-page descriptions

WEEK 3 - BUILD AUTHORITY

- Publish a named owner or lead technician on /about with photo, bio, years in the trade and the NRPP certification number
- Complete GBP verification and mirror it to Bing Places, Apple Business Connect, Yelp, BBB and Angi
- Add the @id-anchored LocalBusiness node with sameAs, streetAddress, postalCode, geo and hours, and drop the unsupported aggregateRating

WEEK 4 - MEASURE & REFINE

- Re-test visibility in ChatGPT & Perplexity now that the crawlers are allowed in
- Run a review request to past customers targeting 20+ Google reviews, then patch remaining gaps

PHASE 2: STAYING RECOMMENDED (ONGOING)

Here's what most businesses get wrong: they treat GEO like a one-time fix. But the foundation isn't the finish line — it's the starting line. AI engines change what they reward every few months, and your competitors keep working. Phase 2 is how you defend the position you built and keep pulling ahead:

- ✓ **Monthly visibility tracking** — we re-score you and your top competitors and show you the movement, so you always know where you stand.
- ✓ **Fresh, citable content** — new answers for the new questions your customers are asking AI.
- ✓ **Authority that compounds** — a steady flow of detailed reviews, citations, and brand signals (Bing, Apple, local directories) that build over time.
- ✓ **Adapting as AI changes** — when the engines shift what they cite, we adjust before it costs you customers.

That's why GEO is a partnership, not a project. The businesses that stay recommended are the ones that keep showing up — and that's the difference between a 30-day bump and a lasting advantage.

**KICKASS
WEBSITES**

STOP LOSING CUSTOMERS TO THE SITES AI RECOMMENDS.

Right now, when someone asks AI who to hire, your competitors are in the answer and you're not. This report is how we change that.

You've seen exactly where your business is invisible to ChatGPT, Google's AI, and Perplexity — and every gap in it is fixable. We don't just hand you a list, and we don't just fix it once. We build the foundation, then keep you recommended as AI and your competitors keep moving.

HERE'S HOW WE GET YOU RECOMMENDED

- ✓ **Done for you, not handed to you** — we implement every fix: schema, llms.txt, content, and crawler access.
- ✓ **We make your content the answer** — clear, structured, and written to be quoted by AI.
- ✓ **We build the trust signals AI looks for** — reviews, profiles, and citations across the web.
- ✓ **The goal is your phone ringing** — from customers who asked AI who to call, not a prettier score.

AI search is being shaped right now. The businesses that move first are the ones it learns to recommend.

Ready to get recommended by AI instead of your competitors?
